

# CSCI 5010 – Fundamentals of Data Communications

## Lab Static and Dynamic Routing

University of Colorado Boulder  
Department of Computer Science  
Network Engineering

Professor Levi Perigo, Ph.D.

## Summary

This lab is intended to be an overview of Cisco IOS configuration, and routing technologies, such as static routes, default routes, link failover, and dynamic routing protocols.

The questions in the lab are intentionally vague. The purpose of this is for you not only to research, investigate, and learn the technologies, but also become proficient at interpreting both non-technical and technical questions. Being able to research and discover answers on your own will be critical as you progress in your career.

- Learn how to perform basic router configuration & troubleshooting including:
  - Configure static routes and populate the routing tables
  - Apply administrative distance for automatic route failover
  - Designing and configuring a routing protocol to create dynamically learned routes
  - Routing protocol convergence and failover

## Part 1

### Objective 1: Network Design and Setup [16 points]

Create the following network topology, enable all the appropriate ports, and configure the basic setup for the devices in the topology.

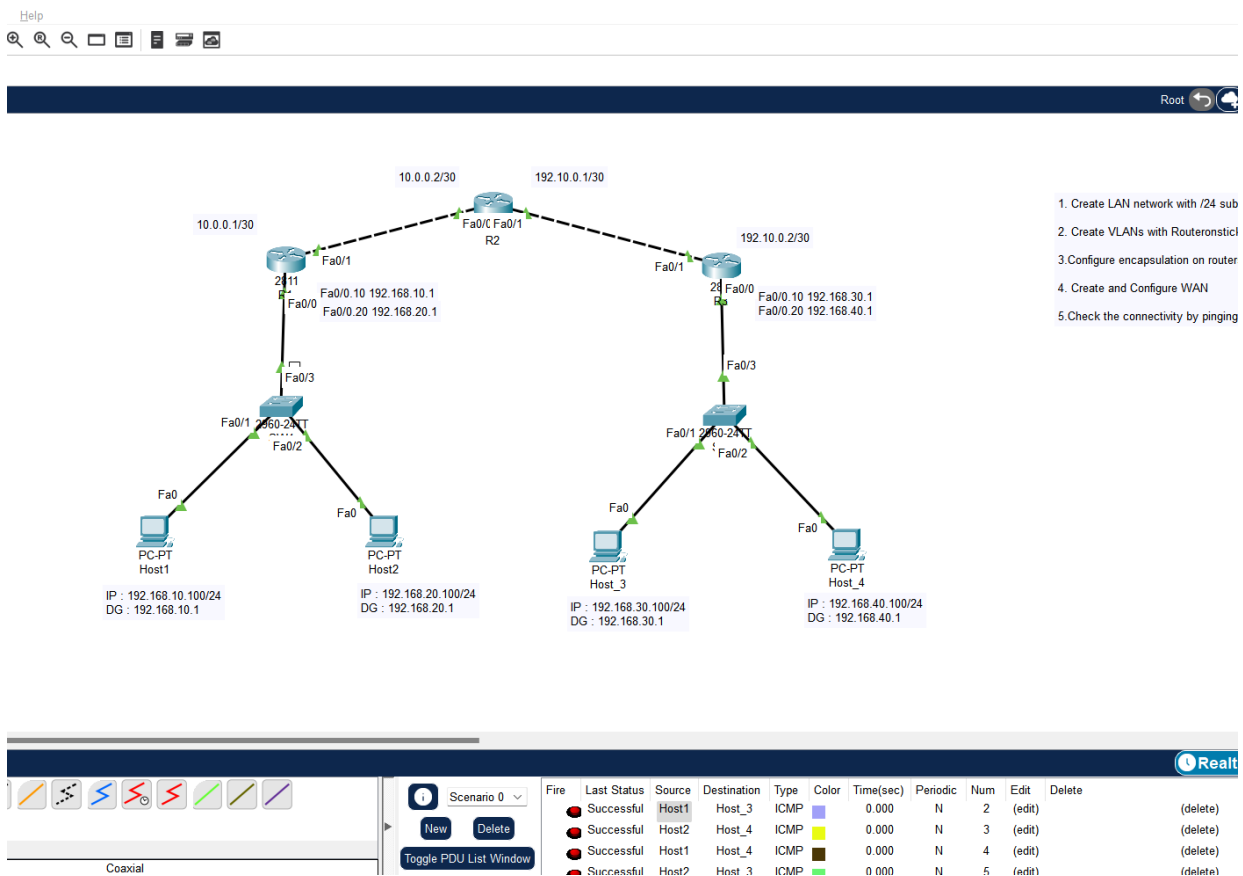

1. Use /24 subnets for all LANs (Each host is in a different subnet) (private IPv4 addresses).  
Other than IP and subnet, nothing else is configured on the hosts.

IP address on host with /24 subnet: 192.168.10.100, 192.168.20.100 192.168.30.100, 192.168.40.100

2. Use /30 subnets for network connecting routers (private IPv4 addresses)

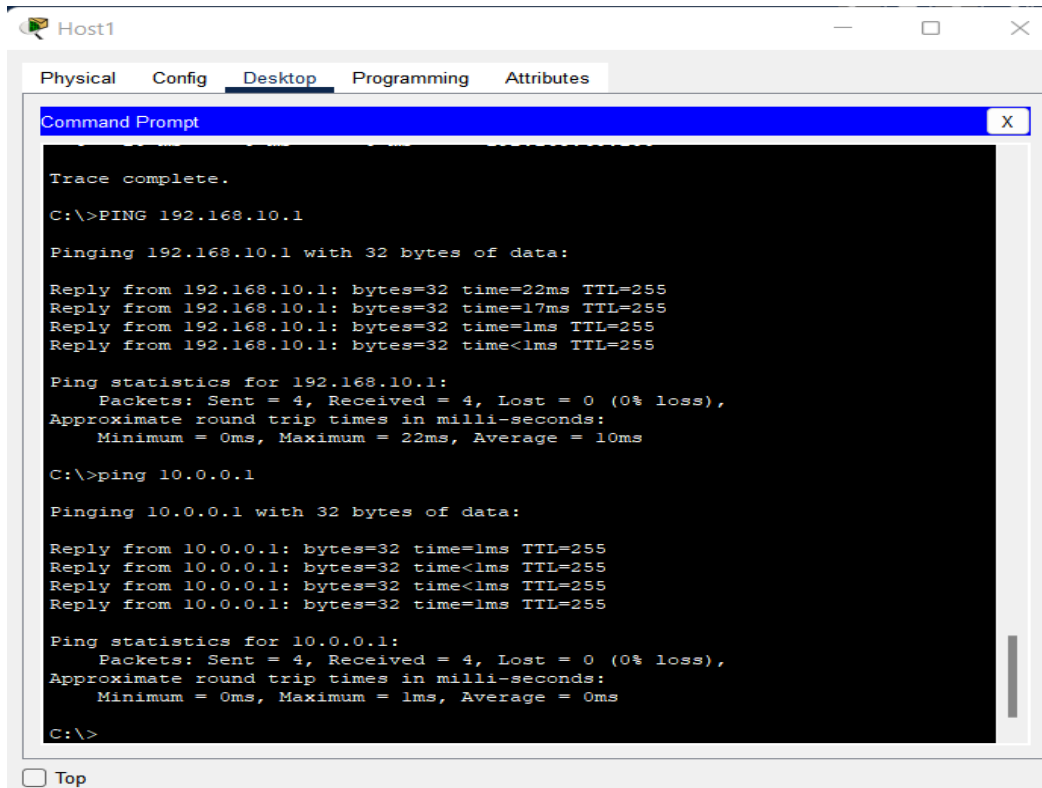

IP address on routers with /30 subnet: 10.0.0.1 10.0.0.2 192.10.0.1 192.10.0.2

Add your addressing scheme to the network diagram (drawing) indicating the subnets for each network, as well as the interface/PC addresses used in your design [10 points]

3. Make sure there is IP connectivity from each PC to the local router (ping the LAN & WAN interfaces).

Host\_1 to Local Router R1 Fa0/0 and WAN Interface Fa0/1 :

The screenshot shows a Windows Command Prompt window titled "Host1". The window has tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes", with "Desktop" selected. The Command Prompt displays the output of two ping commands. The first command is "C:\>PING 192.168.10.1", which shows four successful replies from 192.168.10.1 with varying times (22ms, 17ms, 1ms, 1ms) and a TTL of 255. The second command is "C:\>ping 10.0.0.1", which also shows four successful replies from 10.0.0.1 with times less than 1ms and a TTL of 255. Ping statistics for both destinations show 4 packets sent, 4 received, and 0% loss.

```
Trace complete.
C:\>PING 192.168.10.1

Pinging 192.168.10.1 with 32 bytes of data:

Reply from 192.168.10.1: bytes=32 time=22ms TTL=255
Reply from 192.168.10.1: bytes=32 time=17ms TTL=255
Reply from 192.168.10.1: bytes=32 time=1ms TTL=255
Reply from 192.168.10.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.10.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 22ms, Average = 10ms

C:\>ping 10.0.0.1

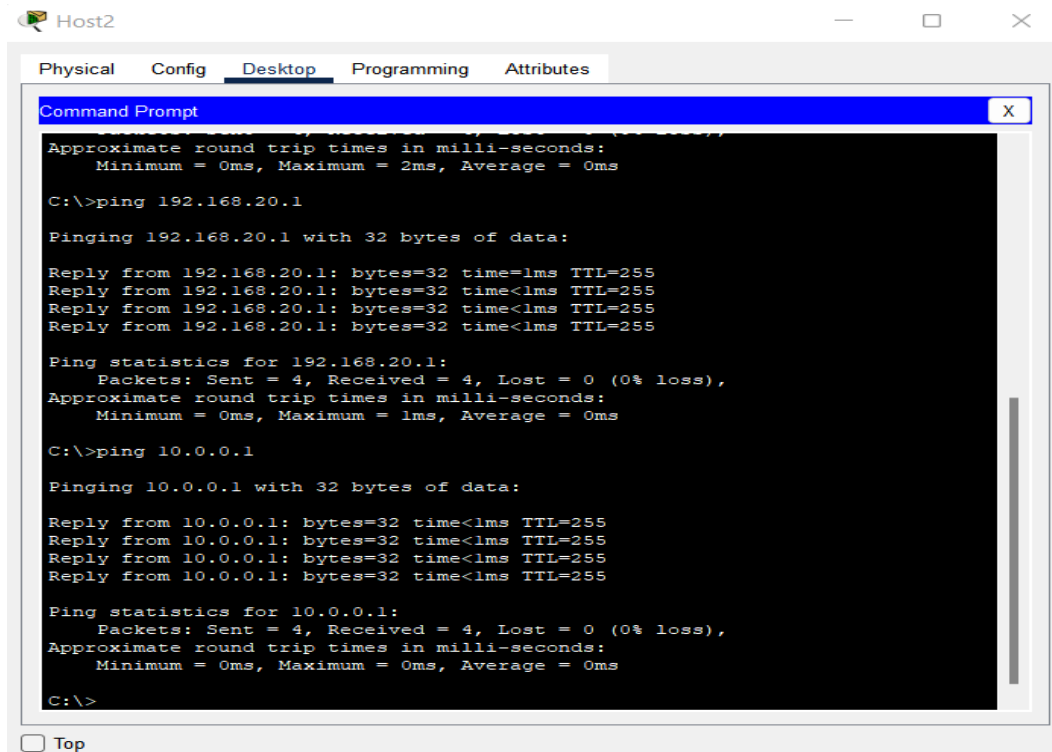

Pinging 10.0.0.1 with 32 bytes of data:

Reply from 10.0.0.1: bytes=32 time=1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time=1ms TTL=255

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>
```

Host\_2 to Local Router R1 Fa0/0 and WAN Interface Fa0/1 :

The screenshot shows a Windows Command Prompt window titled "Host2". The window has tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes", with "Desktop" selected. The Command Prompt displays the output of two ping commands. The first command is "C:\>ping 192.168.20.1", which shows four successful replies from 192.168.20.1 with times less than 1ms and a TTL of 255. The second command is "C:\>ping 10.0.0.1", which also shows four successful replies from 10.0.0.1 with times less than 1ms and a TTL of 255. Ping statistics for both destinations show 4 packets sent, 4 received, and 0% loss.

```
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 2ms, Average = 0ms

C:\>ping 192.168.20.1

Pinging 192.168.20.1 with 32 bytes of data:

Reply from 192.168.20.1: bytes=32 time=1ms TTL=255
Reply from 192.168.20.1: bytes=32 time<1ms TTL=255
Reply from 192.168.20.1: bytes=32 time<1ms TTL=255
Reply from 192.168.20.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.20.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>ping 10.0.0.1

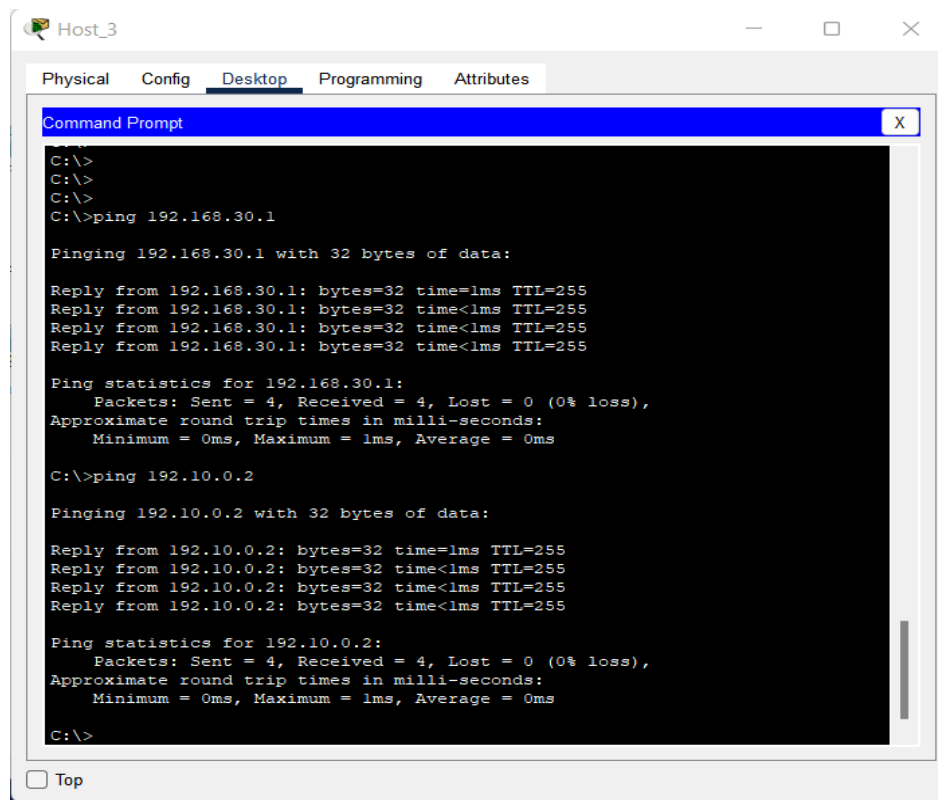

Pinging 10.0.0.1 with 32 bytes of data:

Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

Host\_3 to Local Router R1 Fa0/0 and WAN Interface Fa0/1 :

The screenshot shows a Windows Command Prompt window titled "Host\_3". The window has tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes", with "Desktop" selected. The Command Prompt displays the following text:

```
C:\>
C:\>
C:\>
C:\>ping 192.168.30.1

Pinging 192.168.30.1 with 32 bytes of data:

Reply from 192.168.30.1: bytes=32 time=1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.30.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>ping 192.10.0.2

Pinging 192.10.0.2 with 32 bytes of data:

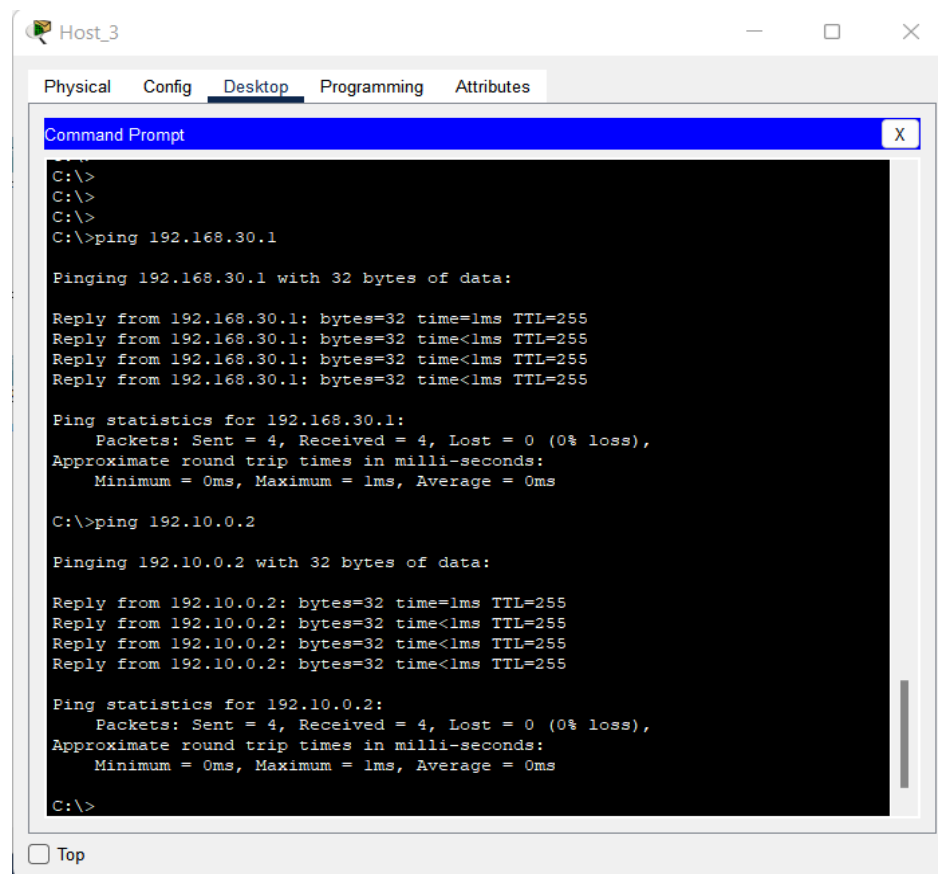

Reply from 192.10.0.2: bytes=32 time=1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 192.10.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>
```

At the bottom of the window, there is a "Top" button.

Host\_3 to Local Router R1 Fa0/0 and WAN Interface Fa0/1 :

The screenshot shows a Windows Command Prompt window titled "Host\_3". The window has tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes", with "Desktop" selected. The Command Prompt displays the following text:

```
C:\>
C:\>
C:\>
C:\>ping 192.168.30.1

Pinging 192.168.30.1 with 32 bytes of data:

Reply from 192.168.30.1: bytes=32 time=1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255
Reply from 192.168.30.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.30.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>ping 192.10.0.2

Pinging 192.10.0.2 with 32 bytes of data:

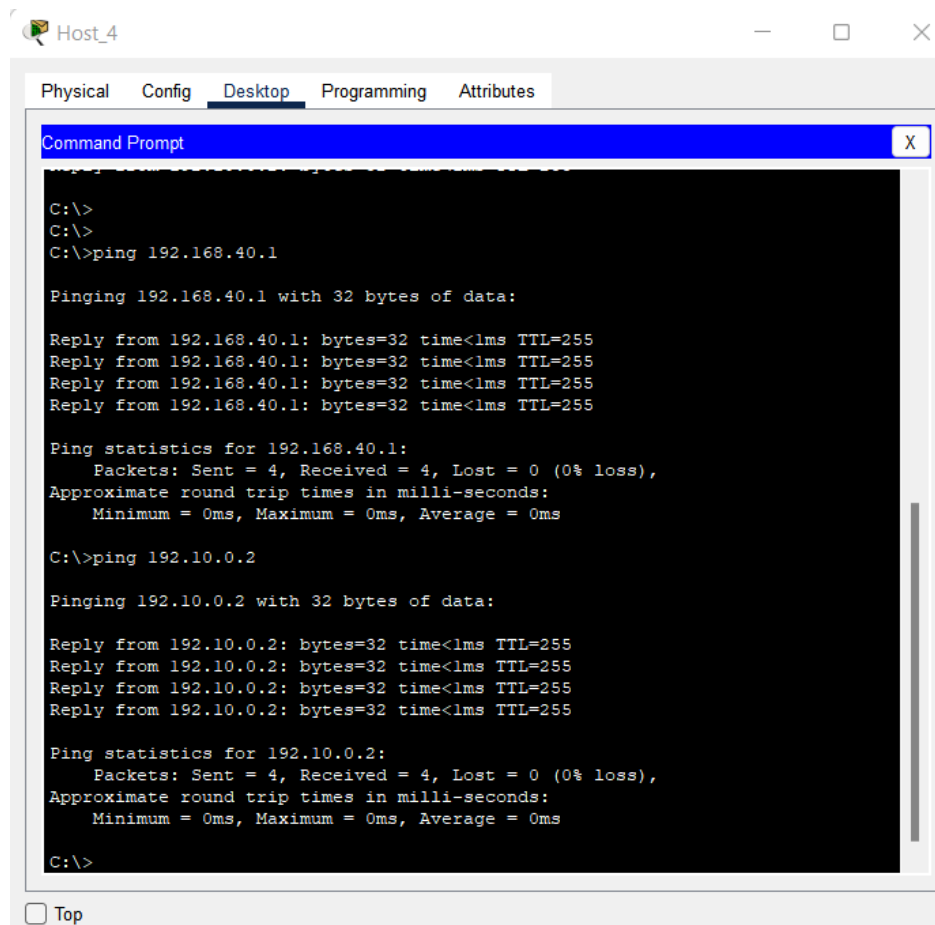

Reply from 192.10.0.2: bytes=32 time=1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 192.10.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>
```

At the bottom of the window, there is a "Top" button.

Host\_4 to Local Router R1 Fa0/0 and WAN Interface Fa0/1 :

```
Host_4
Physical Config Desktop Programming Attributes
Command Prompt
C:\>
C:\>
C:\>ping 192.168.40.1

Pinging 192.168.40.1 with 32 bytes of data:

Reply from 192.168.40.1: bytes=32 time<1ms TTL=255
Reply from 192.168.40.1: bytes=32 time<1ms TTL=255
Reply from 192.168.40.1: bytes=32 time<1ms TTL=255
Reply from 192.168.40.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.40.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>ping 192.10.0.2

Pinging 192.10.0.2 with 32 bytes of data:

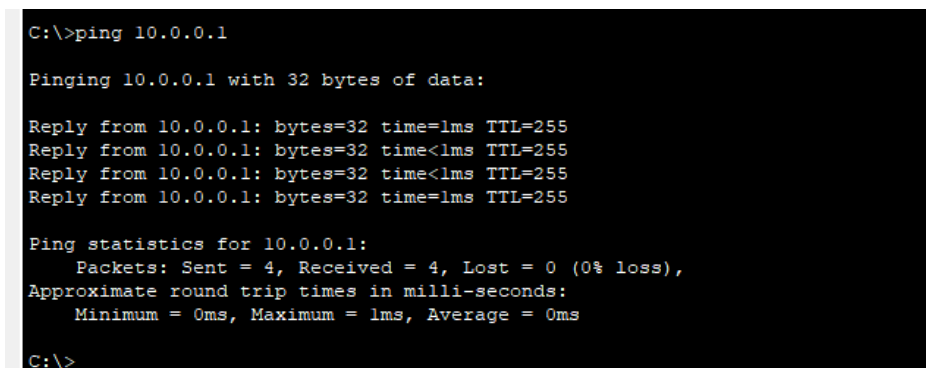

Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255
Reply from 192.10.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 192.10.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

4. Can PC1 ping the WAN interface IP address of R1? Why or why not? [2 points]

Yes. PC1 can ping WAN int IP address of R1

```
C:\>ping 10.0.0.1

Pinging 10.0.0.1 with 32 bytes of data:

Reply from 10.0.0.1: bytes=32 time=1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time=1ms TTL=255

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>
```

5. Is PC1 able to ping R3? Why or why not? [2 points]

No. The PC1 ping to R3 is failing because, the routing protocol is not enabled

6. Explain one reason why PC1 could ping the LAN IP address of R1, but could not ping the WAN IP address of R1. [2 points]

## Objective 2: Static Routing [14 points]

1. Configure static routes in each router to ensure connectivity between all routers and PCs in the network.
  - a. Show the static routes configured
    - i. Show the routes in the route table of R1 and R2 [2 points]

Ans :: **do sh ip route**

```
Router(R1)#
Router(config)#
Router(config)#
Router(config)#
Router(config)#do sh ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
I - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
area
* - candidate default, U - per-user static route, o - ODR
P - periodic downloaded static route

Gateway of last resort is not set

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, FastEthernet0/1
L 10.0.0.1/32 is directly connected, FastEthernet0/1
192.168.10.0/24 is variably subnetted, 2 subnets, 2 masks
C 192.168.10.0/24 is directly connected, FastEthernet0/10
L 192.168.10.1/32 is directly connected, FastEthernet0/10
C 192.168.20.0/24 is directly connected, FastEthernet0/20
L 192.168.20.1/32 is directly connected, FastEthernet0/20
S 192.168.30.0/24 [1/0] via 10.0.0.2
S 192.168.40.0/24 [1/0] via 10.0.0.2

Router(config)#
```

```
Router(R2)#
Router#
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#
Router(config)#do sh ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
I - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
area
* - candidate default, U - per-user static route, o - ODR
P - periodic downloaded static route

Gateway of last resort is not set

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, FastEthernet0/0
L 10.0.0.2/32 is directly connected, FastEthernet0/0
192.10.0.0/24 is variably subnetted, 2 subnets, 2 masks
C 192.10.0.0/30 is directly connected, FastEthernet0/1
L 192.10.0.1/32 is directly connected, FastEthernet0/1
S 192.168.10.0/24 [1/0] via 10.0.0.1
S 192.168.20.0/24 [1/0] via 10.0.0.1
S 192.168.30.0/24 [1/0] via 192.10.0.2
S 192.168.40.0/24 [1/0] via 192.10.0.2

Router(config)#
```

- ii. Show the routes in the running configuration of R3 [2 points]

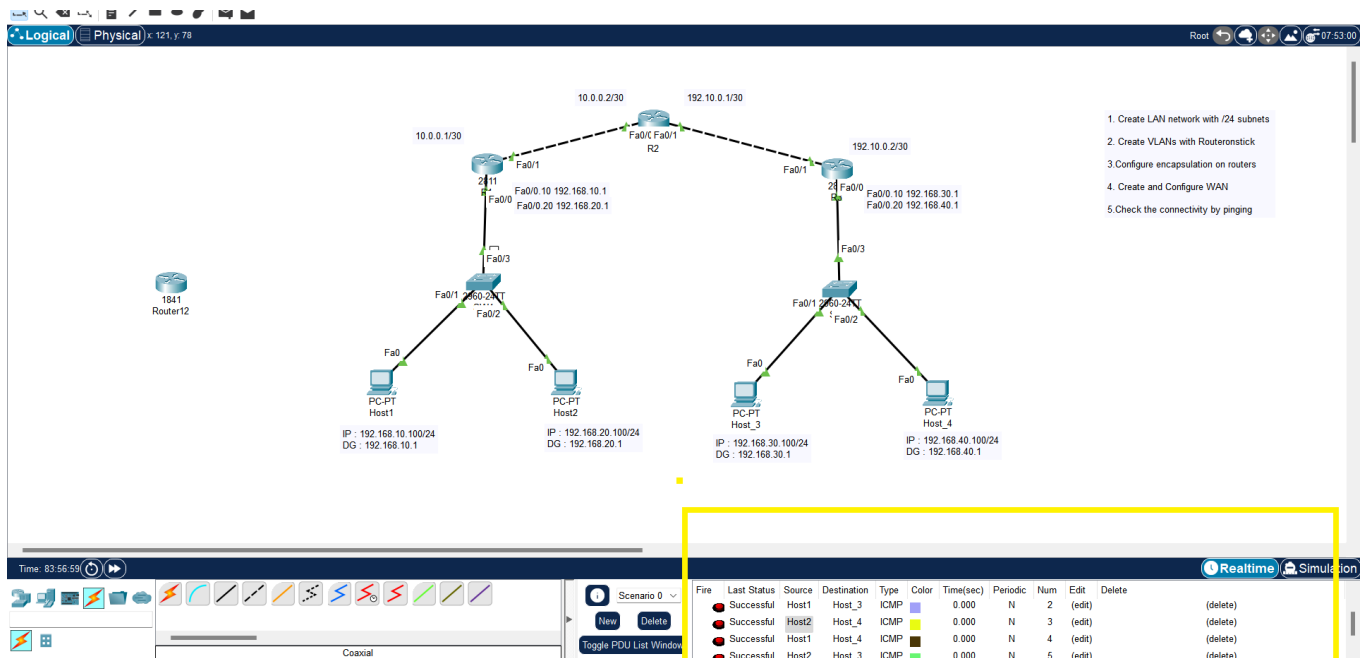

Ans :: **show running-conf**

```

!
interface FastEthernet0/0
no ip address
duplex auto
speed auto
!
interface FastEthernet0/0.10
encapsulation dot1Q 30
ip address 192.168.30.1 255.255.255.0
!
interface FastEthernet0/0.20
encapsulation dot1Q 40
ip address 192.168.40.1 255.255.255.0
!
interface FastEthernet0/1
ip address 192.10.0.2 255.255.255.252
duplex auto
speed auto
!
interface Serial0/2/0
no ip address
clock rate 2000000
!
interface Vlan1
no ip address
shutdown
!
ip classless
ip route 192.168.10.0 255.255.255.0 192.10.0.1
ip route 192.168.20.0 255.255.255.0 192.10.0.1

```

2. Configure Inter-VLAN routing, ensure and maintain 100% connectivity between all devices in the network.

a. Provide the output from traceroutes from PC1 to PC2, 3, & 4 [10 points]

Ans :: Tracert from PC1 to PC2 : tracert 192.168.20.100

PC1 to PC3: tracert 192.168.30.100

PC1 to PC4: tracert 192.168.40.100

The screenshot shows a desktop environment for 'Host1' with tabs for Physical, Config, Desktop, Programming, and Attributes. The 'Desktop' tab is active, displaying a 'Command Prompt' window. The window contains the following text:

```
C:\>tracert 192.168.20.100

Tracing route to 192.168.20.100 over a maximum of 30 hops:

  1  0 ms    0 ms    0 ms    192.168.10.1
  2  0 ms    0 ms    0 ms    192.168.20.100

Trace complete.

C:\>tracert 192.168.30.100

Tracing route to 192.168.30.100 over a maximum of 30 hops:

  1  0 ms    0 ms    0 ms    192.168.10.1
  2  0 ms    0 ms    0 ms    10.0.0.2
  3  0 ms    0 ms    11 ms   192.10.0.2
  4  10 ms   0 ms    0 ms    192.168.30.100

Trace complete.

C:\>tracert 192.168.40.100

Tracing route to 192.168.40.100 over a maximum of 30 hops:

  1  0 ms    0 ms    0 ms    192.168.10.1
  2  0 ms    0 ms    0 ms    10.0.0.2
  3  0 ms    0 ms    1 ms    192.10.0.2
  4  10 ms   0 ms    0 ms    192.168.40.100

Trace complete.

C:\>
```

At the bottom of the window, there is a 'Top' button with a checkbox.

### Objective 3: Understanding Routing Protocols [25 points]

3.1 For the network given below in Figure. 1, give global distance-vector tables **WHEN:**

- (a) Each node knows only the distance of its immediate neighbors. **[4pt]**
- (b) Each node has reported the information it had in the preceding step to its immediate neighbors. **[4pt]**
- (c) Repeat step (b) one more time. **[4pt]**

Figure. 1

Refer the slides below for an example of how to do this question:

lec10-routing\_DV.pdf

<https://www.youtube.com/watch?v=dmS1t2wFrI>

### 3.2 (7 points)

Again for the network graph in Figure. 1. Show how the link-state algorithm builds the routing table for node D.

- Show the detailed link-state algorithm. [5pt]
- Show the final routing table of node D. [2pt]

Refer the slides below for an example of how to do this question:

lec10-routing\_LV.pdf

### 3.3 (6 points)

Consider this directional graph below in Figure 4. Use Dijkstra's algorithm to find the shortest path from node v3 to v5. Write down the **steps**. Do you have any comments on the result (what if the link cost of v3-v1 was 1 instead of 5)? [6 pts]

Figure. 4

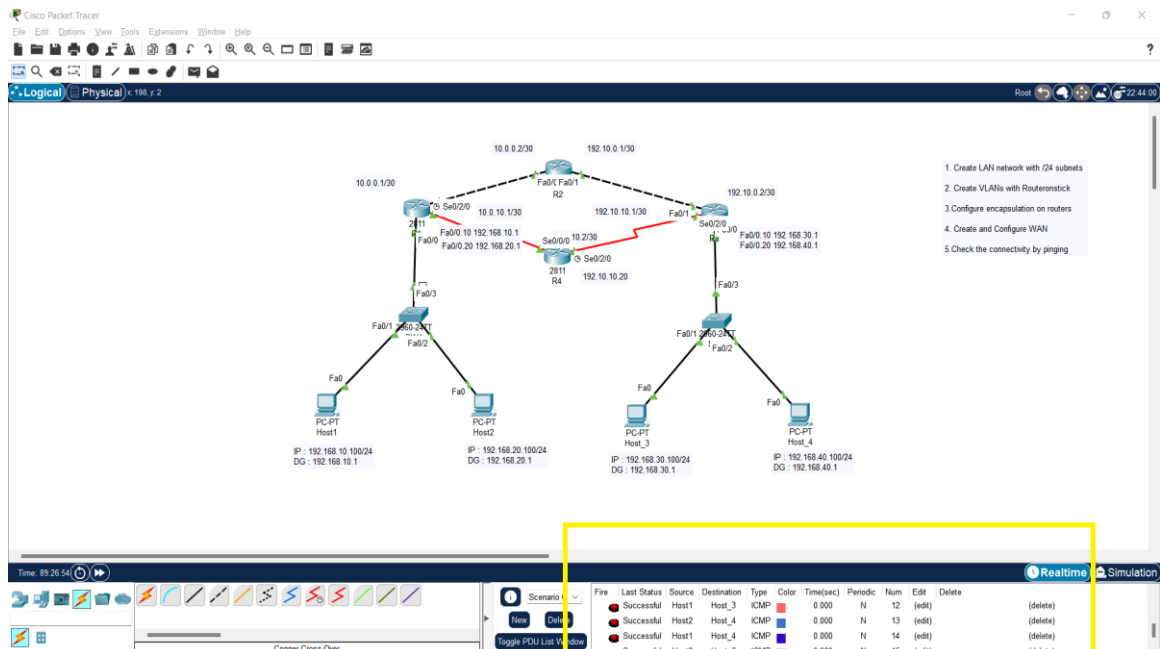

## Objective 4: Dynamic Routing (RIP or OSPF) [30 points]

Create the following network topology, enable all the appropriate ports, and configure the basic setup for the devices in the topology.

1. Remove the static routes from all router configurations.

Configure **RIPv2** or **OSPF** on all router interfaces and networks. :: **RIPV2 is configured**

- a. Provide commands used to implement, screenshot of the route table (from R2 & R4) indicating the network has converged [20 points]

The commands used to implement the RIP V2 Routing are

**ROUTER RIP**

**VERSION 2**

**NETWORK <IP ADDRESS>**

```
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router rip
Router(config-router)#version 2
Router(config-router)#network 10.0.0.1
Router(config-router)#network 192.10.0.1
Router(config-router)#network 10.0.0.0
Router(config-router)#network 192.10.0.0
Router(config-router)#network 192.168.10.0
Router(config-router)#network 192.168.20.0
Router(config-router)#network 192.168.30.0
Router(config-router)#network 192.168.40.0
Router(config-router)#end
Router#
%SYS-5-CONFIG_I: Configured from console by console

Router#wr me
Building configuration...
[OK]
Router#
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#sh ip route
^
```

Copy Paste

- i. What does convergence mean, and why is it important? [10 points]

Convergence or routing convergence is the state in which a group of routers in a network share the same topological information. Routers in a network gather topology information from each other through routing protocols. A state of convergence is reached when all routers broadcast routing information to all routers in the network. In a converged network, all routers are aware of the network topology and the best route to send packets. Changes on the network, such as device failures, affect convergence until information about the change is propagated to all routers and convergence is achieved again. The time it takes for routers in the network to converge after a topology change is called convergence time. Detection, Local Repair, Global repair are the few actions on which convergence speed depends upon.

Why is it important:

1.A converged network makes it easier to manage network performance. In the past, managing network performance was difficult because multiple networks and services could only be managed individually. A converged network provides an efficient and scalable design that allows properties to add new services and features in a more cost-effective manner.

2. A converged network can make it easier to identify and solve problems, and prevent them from escalating. A unified network simplifies cabling and hardware infrastructure. Converged networks connect different services, simplifying cabling and hardware infrastructure.

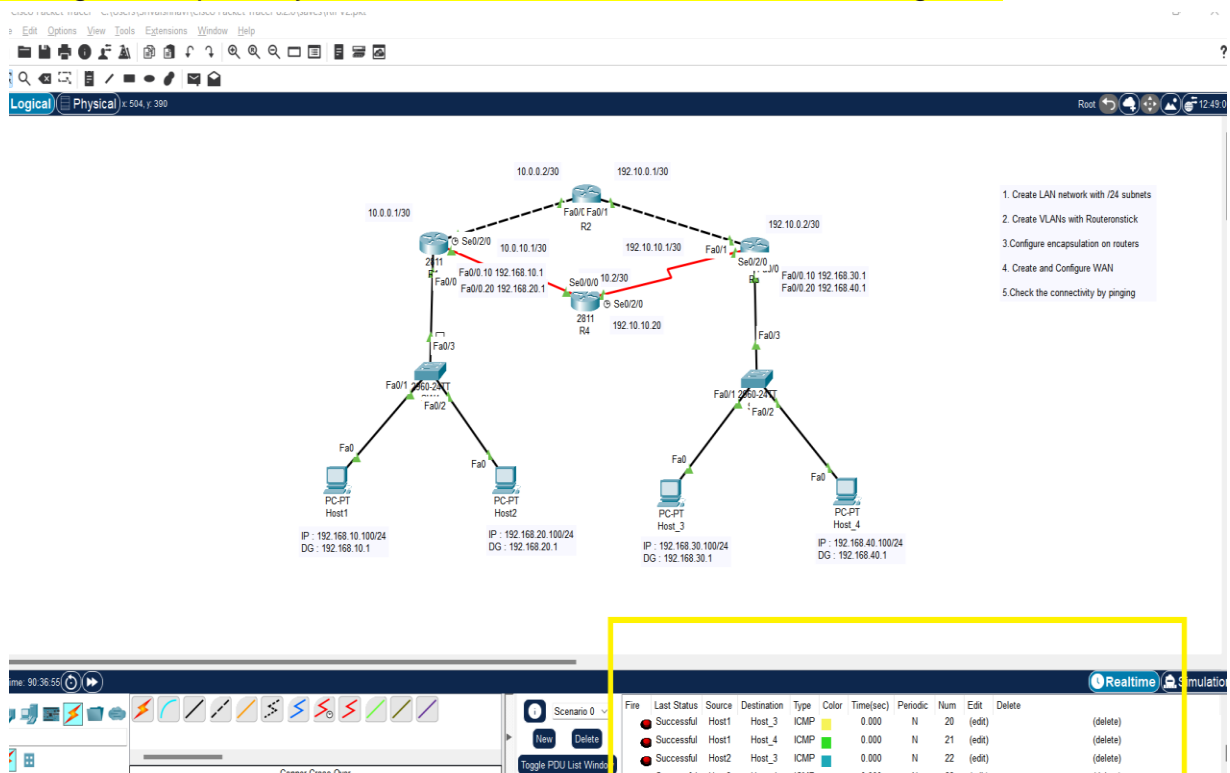

3. Converged networks allow the same equipment and space to be used for multiple systems. This type of network helps eliminate redundancy while optimizing the delivery of all services. Additionally, once your converged network is ready, the infrastructure makes it easy to add new services to your setup. This method is much cheaper than other options.

4. Converged networks can be used to implement better energy resource management. Minimize the need for technical and physical resources by managing, operating and maintaining all your business systems from a single connection. It saves resources, manpower and space. A converged network can help reduce power consumption and maintenance costs, reducing overall environmental impact.

5. A unified network provides a better experience for users. Company members can use the Internet on any device on company premises. This configuration can improve productivity and increase output opportunities. This simplifies the user's experience and administrator's responsibilities. This type of network setup provides everything users need to successfully complete their tasks.

**Extra Credit:** Implement **RIPv2** as well as **OSPF** separately on the network and answer question for Objective 4. **[+5 points]**

**OSPF is configured separately on the network on which RIPv2 was configured:**

The commands used to implement the OSPF Routing are

## ROUTER OSPF 1

NETWORK <IP ADDRESS> <WILD CARD MASK> <AREA>

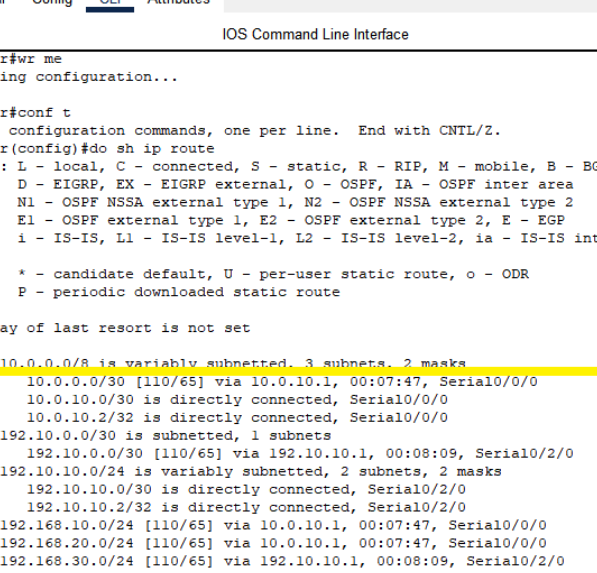

### OSPF configured Routing table from R2:

```
Router>en
Router#conf
Configuring from terminal, memory, or network [terminal]?

```

At the bottom of the window, there are two buttons: "Copy" and "Paste".

## Objective 5: Routing Protocol Failover [17 points]

### 1. Demonstrate Failover

- a. Issue a traceroute from PC1 to PC3. Which path is it taking? [2 points]

Its taking PC1 – R1 – R2 – R3 – PC3 path. Below is tracert from PC1 to PC3

The screenshot shows a Windows Command Prompt window titled "Host1" with tabs for Physical, Config, Desktop, Programming, and Attributes. The Desktop tab is active. The Command Prompt displays the output of a traceroute command. It shows the path from 10.0.0.1 to 192.168.30.100 over a maximum of 30 hops. The path consists of four hops: 1 (5 ms, 0 ms, 0 ms, 192.168.10.1), 2 (0 ms, 0 ms, 0 ms, 10.0.0.2), 3 (0 ms, 0 ms, 0 ms, 192.10.0.2), and 4 (0 ms, 0 ms, 0 ms, 192.168.30.100). The second hop, 10.0.0.2, is highlighted in yellow.

```
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255
Reply from 10.0.0.1: bytes=32 time<1ms TTL=255

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 17ms, Average = 4ms

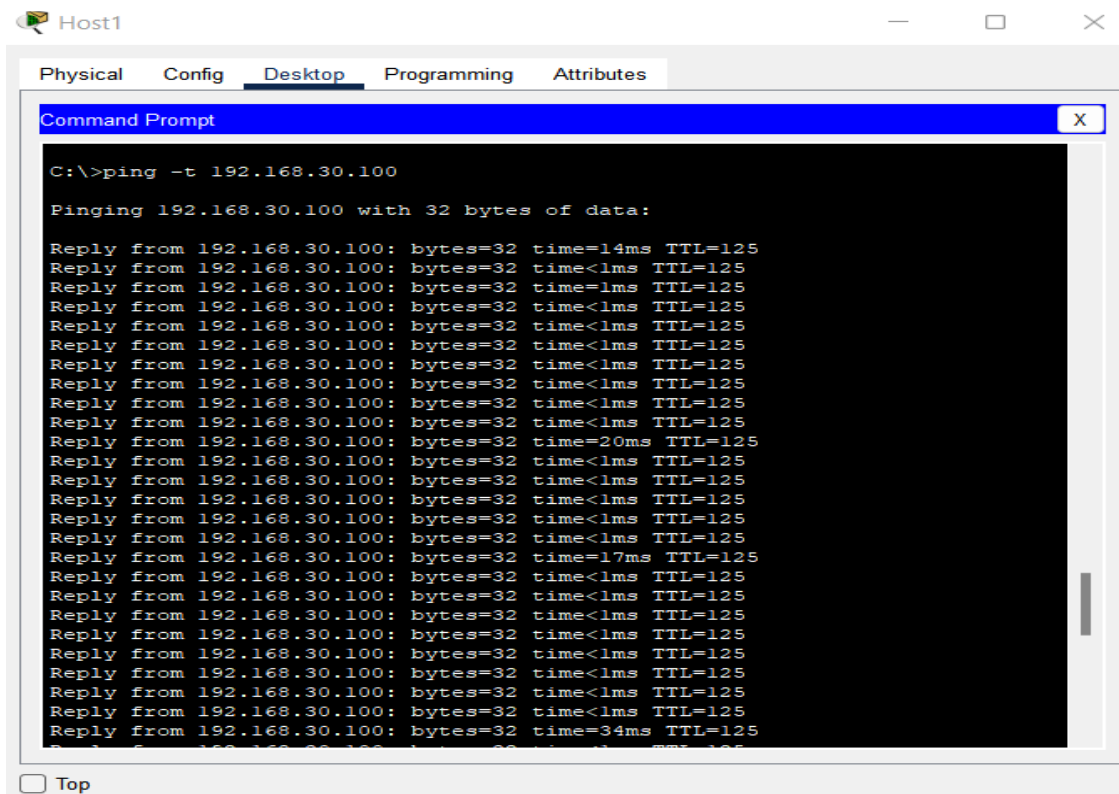

C:\>
C:\>tracert 192.168.30.100

Tracing route to 192.168.30.100 over a maximum of 30 hops:

  0  5 ms    0 ms    0 ms    192.168.10.1
  1  0 ms    0 ms    0 ms    10.0.0.2
  2  0 ms    0 ms    0 ms    192.10.0.2
  3  0 ms    0 ms    0 ms    192.168.30.100

Trace complete.
```

- b. Issue a continuous ping from PC1 to PC3

The screenshot shows a Windows Command Prompt window titled "Host1" with tabs for Physical, Config, Desktop, Programming, and Attributes. The Desktop tab is active. The Command Prompt displays the output of a continuous ping command. It shows the path from 10.0.0.1 to 192.168.30.100 over a maximum of 30 hops. The path consists of four hops: 1 (5 ms, 0 ms, 0 ms, 192.168.10.1), 2 (0 ms, 0 ms, 0 ms, 10.0.0.2), 3 (0 ms, 0 ms, 0 ms, 192.10.0.2), and 4 (0 ms, 0 ms, 0 ms, 192.168.30.100). The second hop, 10.0.0.2, is highlighted in yellow.

```
C:\>ping -t 192.168.30.100

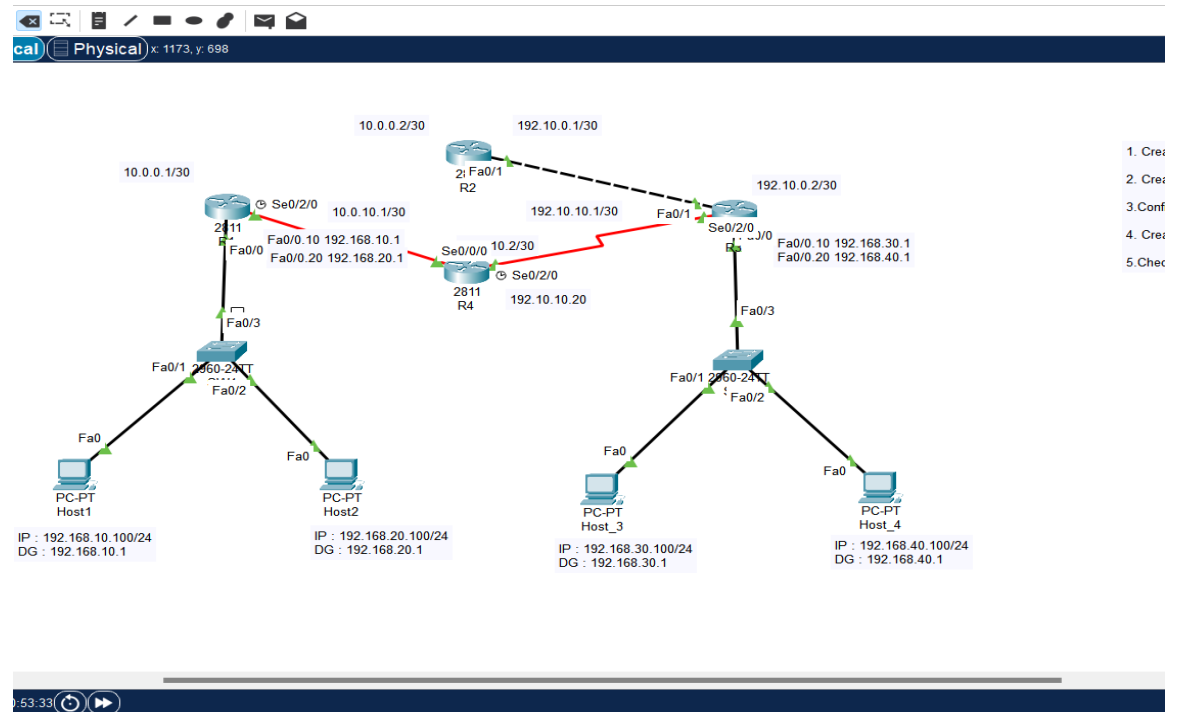

Pinging 192.168.30.100 with 32 bytes of data:

Reply from 192.168.30.100: bytes=32 time=34ms TTL=125
```

- c. Remove the router link/connection between the active path routers (discovered in above [1.a]). For example, if the path was R1, R2, R3, then remove the connection to R2.
- i. Were any packets lost? If packets were lost, how long was the network down? Explain this, and indicate how the traffic failed over and the new traffic flow [5 points]

Removed the path link from R1 - R2

And the ping failed with "Request timed out" for a milli second and then the packet transfer reinitiated with time < ms and 2% packetloss. The new flow is from R1-R4-R3

Difference :: The IP in the above tracert screenshot showed 10.0.0.2 (R2) is changed to 10.0.10.2 (R4), the OSPF protocol dynamically initiated packet flow

```
C:\>
C:\>tracert 192.168.30.100

Tracing route to 192.168.30.100 over a maximum of 30 hops:

  1  6 ms    0 ms    0 ms    192.168.10.1
  2  12 ms   0 ms    0 ms    10.0.10.2
  3  19 ms   16 ms   1 ms    192.10.10.1
  4  1 ms    17 ms   0 ms    192.168.30.100

Trace complete.

- d. Do some critical thinking and research. Could failover be achieved with this network design using only static routes? Explain [10 points]

YES. One way to do is by load balancing the traffic between the links with static routes having same admin distance. And the other is, in this network 10.0.0.1 has two possible next hops, and we could use "qualified next hop" statement on both devices to enable the failover

On R1, configure a static route to the customer network.

[edit routing-options static route 192.168.47.0/24] set next-hop <ip address of R2>

On R1, configure a backup route to the customer network.

[edit routing options static route 192.168.47.0/24] set qualified-next-hop <IP address of R4 > preference

#### Extra Credit [10 points]:

Consider the above network. RIP and OSPF both are simultaneously working on this network.

For H1 to reach H3, R1 gives a RIP path R1-R2-R3 and OSPF gives R1-R4-R5-R3. Which path would packets from H1 going to H3 via R1 take?

Explain why you think a particular path would be chosen.

Thinking from two aspects, one, RIP hop count is less R1-R2-R3 that's three hops compared to

distance from R1-R4-R5-R3, because it is a small network with three routers, as a networking rule, one could use Distance Vector Protocol : RIP. But in this scenario, the best route to the network may not be the route with least hops. Because going by the the concept of Administrative distance – the feature using which the router will chose the preferred path, OSPF Administartive Distance is 110 and RIP Administrative distance is 120, so i think OSPF will be used based on the concept of Administrative distance.

### Report Questions: [18 points]

- What are the advantages of using routing protocols?

Failure of one line doesn't affect the whole network

Incase of failure of a particular link, because of network convergence, routing protocol enables auto re-route via other path links without any manual intervention

Routing protocols generally work independent of network size

Suitable for larger and complex networks

Fewer router resource overhead requirements

- What is the difference between Distance Vector and Link State Routing protocols?

Distance Vector	Link-State
uses Bellman-Ford Algorithm for making routing tables.	use of Dijkstra's Algorithm for making routing tables
Topology information from neighbour point of view	Complete information on network topology
Based on least no. of HOPS	Based on COST
Periodic updates	Triggered updates
moderate convergence time	Fast covergence time
Updates using broadcast	Updates using multicast
RIP,IGRP, EGRP	OSPF, IS-IS

- What are the advantages of using static routing or when would static routing be preferred over dynamic routing?

Static Routes are not advertised over the network, hence enables better security

Static Routes use less bandwidth as routers don't exchange routes

Static Routes don't use cpu cycle to calculate and communicate the routes

Static Routing is preffered over dynamic routing for smaller networks with only one path to an outside network. They also provide security in a larger network for certain types of traffic or links to

other networks that need more control

- Classify the below routing protocols as Distance Vector and Link State Routing protocols:

I. OSPF, BGP, RIP, IS-IS

OSPF, IS-IS – Link-state Routing protocols

RIP – Distance Vector protocol

BGP – Path Vector protocol

- Give:

- Scenario when distance vector routing protocol would be used in the network.

Distance vector are great for smaller networks, usually less than 100 routers, It uses hop count, so for example, For example, if there are 3 offices located in the same city, each office has its own network and if the PC1 from office 1 is trying to telnet to PC4 in the office 3, and the packet must cross three routers to get to PC4, then the hop count is three – in such cases distance vector is used.

- Scenario when link state routing protocol would be used in the network.

Link-state are used for larger networks with fast convergence for example, consider there is 14 offices, located in different states of america, and each office has it's own ISP provider (AT&T, Charter, etc.); just whatever is available at that location. Each office is it's own network. Those 14 sites are connected to a Data Center network, and if you want to achieve interconnection between , all the office and also some selective offices only

14 offices - <data center>

Office 1 – Office 4

Office 6 – Office 12

Office 14 – Office 2

In this case we use link state protocol for two reasons shortest routing path selection and also the faster convergence helps in early fault detection when link-state is used in large enterprise networks.

- What is an Administrative Distance (AD) for a routing protocol? Give AD for OSPF and RIP.

Administrative Distance Administrative distance is property that routers use in order to select the best route path when there are two or more different routes to the same destination. The DEFAULT AD value is 120 for RIP routes and 110 for OSPF Routes.

- What is a metric in a routing protocol?

Metric is a numerical value associate with specific routes that are used by routing protocols to prioritize the most preffered route to the least preferred route. Different routing algorithms use different variables to compute the route metric. The metrics are calculated based on the one or more following attributies :

1. Bandwidth
2. Cost
3. Path Length
4. Reliability

Total Score = \_\_\_\_\_/135
